

## CLAIMS

1. Windshield wiper device (10), in particular for a motor vehicle, comprising a support (12), on which at least one bearing (18) is arranged, which supports at least one wiper shaft (22), characterized in that at least one retaining element (20) is provided, which detachably connects the bearing (18) to the support.
2. Windshield wiper device (10) according to Claim 1, characterized in that the support (12) has a receptacle (34) to accommodate the bearing (18).
3. Windshield wiper device (10) according to one of the preceding claims, characterized in that the bearing (18) includes at least one tube.
4. Windshield wiper device (10) according to one of the preceding claims, characterized in that the retaining element (20) is embodied as a clip.
5. Windshield wiper device (10) according to Claim 4, characterized in that the clip (20) grips around the bearing (18) at least partially in a radial fashion.
6. Windshield wiper device (10) according to one of the preceding claims, characterized in that the support (12) has an at least partially flattened area (44) and the bearing (18) includes a plate (42) that is fastened on the flattened area (44) of the support (12).
7. Windshield wiper device (10) according to Claim 6, characterized in that the plate (42) on the support (12) is fastened via predetermined breaking elements.
8. Windshield wiper device (10) according to one of the preceding claims, characterized in that the bearing (18) is accommodated in a guide (34) of the support (12) and the retaining element (20) is embodied as a speed nut.
9. Windshield wiper device (10) according to Claim 8, characterized in that the guide (34) has a step (68) to form an inclined plane.
